**MULTISCALE MODELING OF HUMAN ADDICTION: A COMPUTATIONAL
HYPOTHESIS FOR ALLOSTASIS AND HEALING**

A Dissertation Presented

by

YARIV Z. LEVY

Approved as to style and content by:

Andrew G. Barto, co-Chair

Jerrold S. Meyer, co-Chair

Sridhar Mahadevan, Member

Neil E. Berthier, Member

Lori A. Clarke, Department Chair
Computer Science

DEDICATION

*To my parents,
to my family,
and to my friends.*

ACKNOWLEDGMENTS

I express my deepest gratitude to my co-Advisors, Professor Andrew G. Barto and Professor Jerrold S. Meyer. Professor Barto taught me why essence is the most elegant art of science, and Professor Meyer planted the seeds which bloomed.

I am grateful to the other members of my committee, Professor Sridhar Mahadevan and Professor Neil E. Berthier. Professor Mahadevan encouraged me to be meticulous, and Professor Berthier showed me how a good question can lead to a better answer.

I also express my deepest gratitude to Professor Dino J. Levy who taught me the fundamentals of drug addiction and encouraged me throughout my work. I was also guided and encouraged by Professor Hava T. Siegelmann during the early stages of my research.

I was fortunate to meet and interact with many colleagues, fellows, and teammates during the course of my stay at University of Massachusetts Amherst. I thank them for their curiosity, encouragement, and support.

I wish to thank the staff of the Department and of the University, including the Computer Science Administrative assistants, the Computer Science Computing Facility, the UMass Amherst Libraries, and the UMass Physical Plant Division. Their help was essential for successful completion of my PhD.

My work was supported in part by the National Science Foundation under NSF Grant #CNS-0619337. Any opinions, findings, conclusions or recommendations expressed here are the author's and do not necessarily reflect those of the sponsor.

ABSTRACT

MULTISCALE MODELING OF HUMAN ADDICTION: A COMPUTATIONAL HYPOTHESIS FOR ALLOSTASIS AND HEALING

Directed by: Professor Andrew G. Barto and Professor Jerrold S. Meyer

This dissertation presents a computational multiscale framework for predicting behavioral tendencies related to human addiction. The research encompasses three main contributions. The first contribution presents a formal, heuristic, and exploratory framework to conduct interdisciplinary investigations about the neuropsychological, cognitive, behavioral, and recovery constituents of addiction. The second contribution proposes a computational framework to account for real-life recoveries that are not dependent on pharmaceutical, clinical, and counseling support. This exploration relies upon a combination of current biological beliefs together with unorthodox rehabilitation practices, such as meditation, and proposes a conjecture regarding possible cognitive mechanisms involved in the recovery process. Further elaboration of this investigation leads on to the third contribution, which introduces a computational hypothesis for exploring the allostatic theory of addiction. A person engaging in drug

consumption is likely to encounter mood deterioration and eventually to suffer the loss of a reasonable functional state (e.g., experience depression). The allostatic theory describes how the consumption of abusive substances modifies the brain's reward system by means of two mechanisms which aim to viably maintain the functional state of an addict. The first mechanism is initiated in the reward system itself, whereas the second might originate in the endocrine system or elsewhere. The proposed computational hypothesis indicates that the first mechanism can explain the functional stabilization of the addict, whereas the second mechanism is a candidate for a source of possible recovery.

The formal arguments presented in this dissertation are illustrated by simulations which delineate archetypal patterns of human behavior toward drug consumption: escalation of use and influence of conventional and alternative rehabilitation treatments. Results obtained from this computational framework encourage an integrative approach to drug rehabilitation therapies which combine conventional therapies with alternative practices to achieve higher rates of consumption cessation and lower rates of relapse.

ABSTRACT.....	vii
LIST OF TABLES	xii
LIST OF FIGURES	xiii
CHAPTER	
1. INTRODUCTION	1
1.1 Historical account of addiction in humankind.....	4
1.2 Maturing out of addiction and natural recoveries	8
1.3 Contributions.....	10
2. BACKGROUND: BIOLOGICAL MODELS OF ADDICTION.....	14
2.1 The physical dependence model	16
2.2 The positive reinforcement model.....	18
2.3 The incentive-sensitization model.....	19
2.4 The opponent-process model	20
2.5 The allostatic model	21
2.6 The disease model.....	24
2.7 The impaired response inhibition and salience attribution model	27
3. RELATED WORK: COMPUTATIONAL MODELS OF ADDICTION	29
3.1 Epidemiological models	30
3.2 Economic models.....	32
3.3 Quantitative pharmacological models	35
3.4 Abstract models of dopamine functions.....	36
3.5 Knowledge repository models.....	39
3.6 Relations to the model advanced in this dissertation.....	43
4. FIVE-STEPS TOWARD A COMPUTATIONAL MODEL	48
4.1 Formalization of the biology underlying addiction	50
4.2 Demonstration of expandability.....	51

4.3	Qualitative validation.....	53
4.4	Dynamical properties analysis	54
4.5	Sensitivity analysis.....	56
4.6	Concluding remarks	58
5.	HYPOTHESIS-DRIVEN FRAMEWORK FOR MATURING OUT	60
5.1	A Multiscale Model of Addiction	60
5.2	Methods	64
5.2.1	Probability of a recovery process.....	66
5.3	Results: plausible scenarios of drug-seeking and maturing out.....	69
5.3.1	Baseline simulations	69
5.3.2	Direct Influence of the Recovery Process	70
5.3.3	Direct and Potentially Long-Term Influences of the Recovery Process	70
5.4	Analysis: a cognitive learning mechanism to enable maturing out.....	75
5.5	Concluding Remarks.....	78
6.	A COMPUTATIONAL HYPOTHESIS FOR ALLOSTASIS	81
6.1	Introduction	82
6.2	Methods: Computational framework for allostasis	85
6.2.1	Model validation and provisional assumption.....	91
6.3	Results.....	92
6.3.1	Baseline: constant reward set point and constant baseline reward threshold	94
6.3.2	Case Study 1: Allostatic state trajectory during escalation of drug consumption.....	97
6.3.3	Case Study 2: Allostatic state trajectory during conventional therapies	99
6.3.4	Case Study 3: Allostatic state trajectory during alternative medical treatments	101
6.4	Concluding remarks	110

7.	DISCUSSION AND CONCLUSION	111
	7.1 Biological conjectures and limitations	112
	7.2 The model's high dimensionality	114
	7.3 Conclusion: implications for treatments	116
